# Purpose of this study

- This paper investigates the bimodal and bilingual development of **discourse referencing** in the **Cantonese** and **Hong Kong Sign Language (HKSL)** **narratives** of 15 Deaf/hard-and-hearing d/hh) children.
- The d/hh children study in a sign-bilingual (i.e., sign and spoken language) co-enrolment (i.e., D/hh and hearing students) programme in which Hong Kong Sign Language and Cantonese are the two major teaching languages.

# Outline

- Literature Review
- Research questions
- Methodology
- Findings
- Discussion

# Literature Review: Bimodal Bilingualism

- Bimodal bilingualism - 2 types of bilinguals:
  - unimodal bilinguals – bilinguals with two spoken languages or two sign languages.
  - Bimodal bilinguals - bilinguals who use a spoken language and a sign language.
- Issues commonly addressed in bilingual studies:
  - How separate are the bilingual child's languages?
  - Can one language influence the other in the course of development?

(Lillo-Martin et al. 2009)

# Bimodal Bilingualism

- Previous studies on bimodal bilingualism mostly focused on children who are native users of the spoken and sign languages (e.g. hearing children of deaf adults).
- Very few have looked at the bimodal and bilingual development of d/hh children from hearing families who have limited auditory input and whose access to sign language is delayed. These d/hh children, however, represent the majority in the deaf population.
- This study aims to look at the development of discourse referencing of a group of 15 d/hh, most of them growing up in hearing families.

# Discourse referencing in narratives

- How different characters are **introduced**, **maintained** and **reintroduced** by nominal expressions in a narrative discourse.
- Levelt (1989):
  - Decisions about which nominal expressions are used in the discourse are based on the speaker's presupposition about the listener's knowledge of the referents.

# Discourse referencing in narratives

- Referencing strategies in English:

Referential functions	Types of nominal expressions
Introduction	Indefinite noun phrases e.g. <b>a cat, a bird</b>
Maintenance	Definite noun phrases e.g. <b>he, she, the cat, that dog, null NPs</b>
Reintroduction	Definite noun phrases e.g. <b>that cat, the dog</b>

# Discourse referencing in narratives

- Referencing strategies in Cantonese:

	Preverbal position	Postverbal position
<b>Dem + cl + n</b> 呢本書	<b>Definite (deictic)</b> 呢本書好好睇	<b>Definite (deictic)</b> 我睇過呢本書
<b>num + cl + n</b> 三本書	They can occur but don't yield a specific reading.	<b>Indefinite</b> 我睇過三本書
<b>cl + n</b> 本書	<b>Definite</b> 本書好好睇	<b>Indefinite / Definite</b> 我想買本書
<b>bare noun</b> 書	<b>Generic</b> 書係知識的寶庫	<b>Indefinite / Generic</b> 我想買書

Classifiers in Cantonese: important for marking definiteness in nominal expressions.

Dem = demonstrative; num = numeral; cl = classifier ; n = head noun

Bare noun = noun phrases without dem, num and cl.

# Development of discourse referencing in narratives

- Encoding reference with appropriate nominal expressions is a late-acquired skill among hearing children (e.g. Warden 1976, Bamberg 1987, Wigglesworth 1990, Wong & Johnston 2004, To 2006, etc).

## Younger children (e.g. age 5 or below)

- Tend to misuse definite nominal expressions for referent introduction.
- Ambiguous use of pronominals for referents switching.
- Better performance in referent maintenance and reintroduction due to more correct use of definite forms.

# Development of discourse referencing in narratives

## Older children (age 6 or above):

- Age 6: begin to use indefinite nominal expressions appropriately for referent introduction.
- Age 8: Begin to use syntactically full-fledged nominal expressions to introduce referents.
- Age 10 or above: complete mastery of discourse referencing (i.e. appropriate introduction, reintroduction and maintenance).

# Discourse referencing in sign languages

In sign languages, referential strategies include:

- Different types of nominal expressions
  - Full noun phrases
  - Indexing (i.e. pointing signs) (Morgan 1996)
- Other aspects of grammar that can provide clues for discourse referencing (i.e. help identifying the referents):
  - Verb agreement (VA)
  - Role shift (RS)
  - Classifier predicates (particularly semantic classifiers) (CL)
  - Locus
  - Eyegaze
- (Engberg-Pedersen 1995, 2004; Morgan 1996, 2005)

# Discourse referencing in sign languages

- Many of these strategies involve the use of space:
  - Lexical nouns
  - Pronominal (pointing)
  - Null arguments
  - Determiner (pointing) + noun/classifier
  - Verb agreement (VA)
  - Role shift (RS)
  - Classifier predicates (CL)
  - Locus
  - Eyegaze

# Development of discourse referencing in sign languages

## **Study on British Sign Language (BSL) (Morgan 2005):**

12 deaf children aged between 4-13 years old were elicited to tell a story “Frog Where Are You? ” by BSL.

### **Group 1 (aged 4-6)**

- do not show the ability to use appropriate forms for different referential function, like using the classifier in maintenance without specifying the referents.
- focus on referencing on the level of sentence but fail to balance the demand of larger unit of the discourse.

# Development of discourse referencing in sign languages

## Group 2 (aged 7-10)

- show the developmental improvement by using the noun phrase more appropriately for referential function.

## Group 3 (aged 11-13)

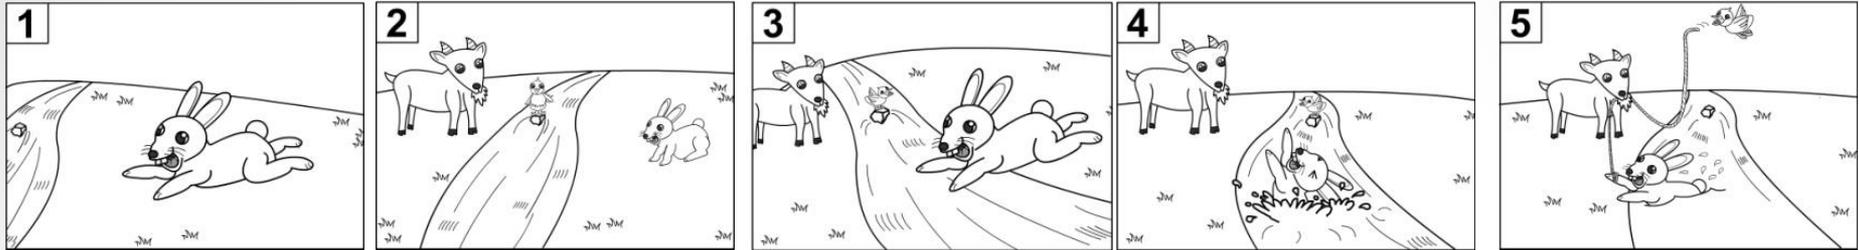

- show the ability to map different ways for referencing with different referential functions. Noun phrase is the main strategy for introduction and reintroduction (90-100%) whereas classifiers and role-shift compose the majority in maintenance (over 70%) among the children aged 11-13.

# Research questions

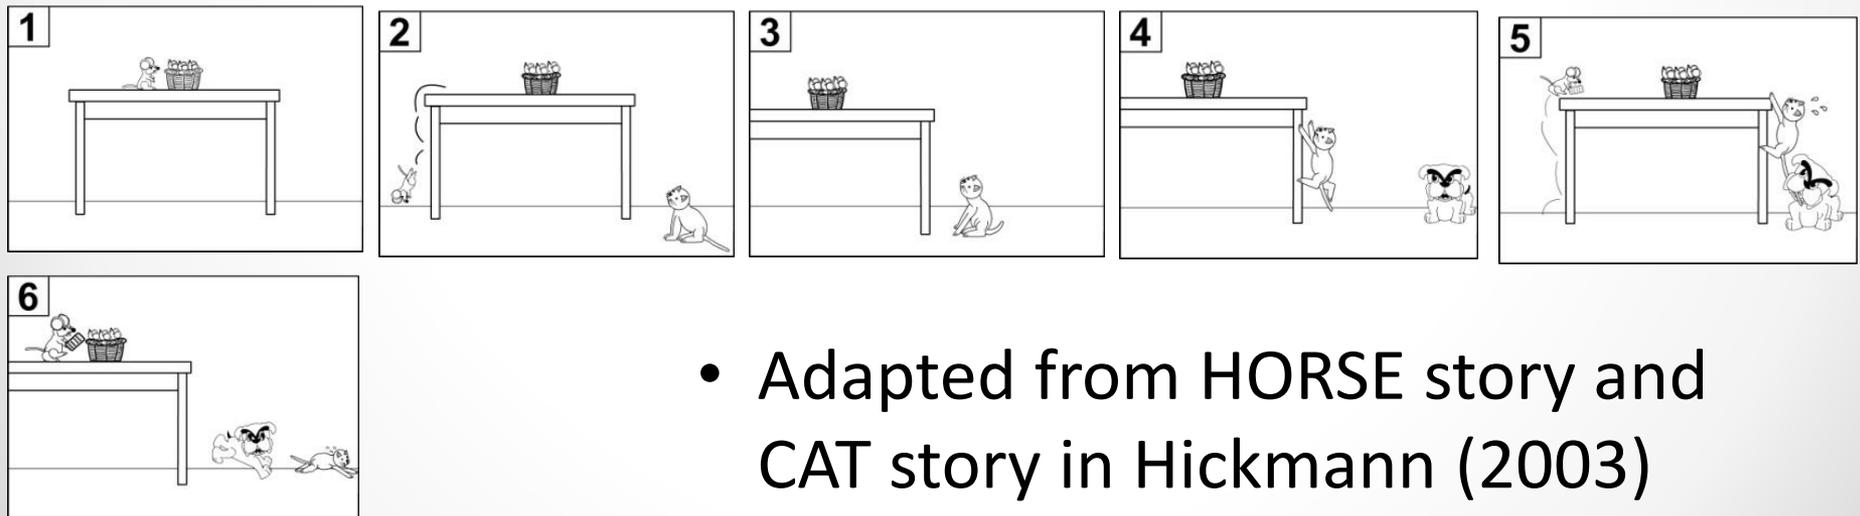

- What referential strategies do d/hh children adopt in their HKSL narratives? Are they approximating adult grammar as their signing proficiency improves?
- What referential strategies do d/hh children adopt in their development of discourse referencing in Cantonese? Are they approximating adult grammar as their speech proficiency improves ?
- Can the d/hh children distinguish the two language systems? Would there be any interlinguistic transfers? If yes, what are the transfer patterns? What are the possible contributing factors?

# Methodology

- 2 picture-based stories for elicitation
- BUNNY Story

- MOUSE Story

- Adapted from HORSE story and CAT story in Hickmann (2003)

# Methodology – d/hh children

- 15 d/hh kindergarten and primary school children (age between 5;5 and 9;11) who were studying in the sign bilingual co-enrolment programme.
- **Sign bilingual**: emphasizes the use of spoken language and natural Hong Kong Sign Language in classes
- **Co-enrolment**: d/hh and hearing children study in the same class (6 d/hh + 15 – 25 hearing classmates)

# Methodology – d/hh children

- These 15 d/hh children are grouped into four levels of spoken Cantonese proficiency according to their language age measured by Reynell Developmental Language Scales – Cantonese version (the Expressive Scale).

<b>Levels of proficiency</b>	<b>Spoken Language age</b>	<b>No. of d/hh children</b>
Level 1	below 4	2
Level 2	4 – 4;11	4
Level 3	5 – 5;11	4
Level 4	6 or above	5

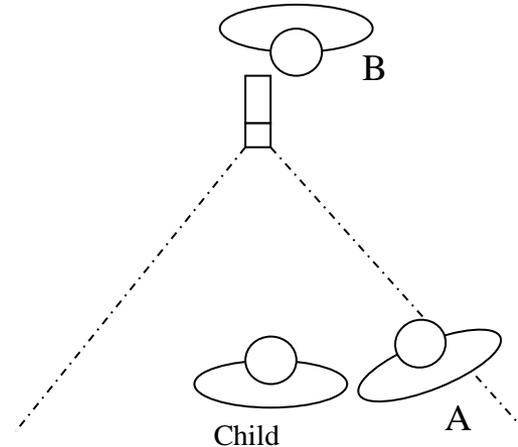

# Methodology – d/hh children

- They are also grouped into different sign language proficiency levels basing on an evaluation of their narratives along several parameters (e.g. content, grammar, lexical items, non-manual, use of space).

<b>Levels of proficiency</b>	<b>No. of children</b>
Level 1 (lowest)	3
Level 2	5
Level 3	4
Level 4 (highest)	3

# Methodology: narrative elicitation

- Hickmann (2003):

- Story telling task:
  - Each child was given time to look at the pictures
  - Each child was asked to tell the story to the addressee, so that the latter could re-tell the story to the child

# Methodology

- Baseline data collected for comparison:
  - HKSL signing narrative data:
    - 4 HKSL native signers (2M & 2F).
  - Cantonese spoken narrative data
    - 6 native speakers of Cantonese (5F & 1 M).
    - 14 hearing children:

Levels	Chronological age	No. of hearing children
Level 1	below 4	2
Level 2	4 – 4;11	4
Level 3	5 – 5;11	4
Level 4	6 or above	4

# Findings: HKSL narratives (adults)

- Adult HKSL users:

	Lexical noun	Lexical noun + IX	Pronominals	Null arguments	Total
<b>Introduction</b>	16 (55%)	13 (45%)			29 (100%)
<b>Maintenance</b>	13 (5%)	20 (7%)	16 (6%)	229 (82%)	278 (100%)
<b>reintroduction</b>	17 (28%)	34 (56%)	5(8%)	5 (8%)	61 (100%)

## *Introduction*

- Lexical noun / lexical noun + IX; obligatory gaze at addressee.
- Anchoring the newly introduced referents in the signing space by:
  - indexical pointing within the nominal expression.
  - a semantic/entity classifier predicate that follows the nominal expression.

RABBIT

PLAY

RUN

move+CL\_sem:rabbit

“A rabbit played and ran across (the grass).”

(introduction: bare noun + gaze at addressee + SemCL)•

## ***Maintenance***

- Mainly null arguments; some pronominals or IX + N.
- Among 317 tokens with null arguments for maintenance, 53% are followed by role-shift, 38% are followed by semantic/entity classifier predicates; 32% are followed by agreement verbs → provide clues for reference tracking.

IX

RABBIT

CL: run around

PLAY

GET-SIGHT-OF

Maintenance

(maintenance: null argument + SemCL + verb agreement)

## ***Reintroduction***

- Strong preference to use overt NPs.
- In a minority of cases where no overt NPs are used, clues are available from classifier predicates, verb agreement, role shift, etc.

(reintroduction: bare noun only)

# Findings: HKSL narratives (d/hh children)

Linguistic forms	introduction	maintenance	reintroduction	Total
n	86 (76.8%)	75 (31.8%)	136 (82.9%)	297 (58.6%)
HAVE + n	14 (12.5%)		1 (0.6%)	15 (3%)
IX (correct direction)		9 (3.8%)	3 (1.8%)	12 (2.4%)
IX (unclear/incorrect direction)		1 (0.4%)		1 (0.2%)
IX + n (unclear/incorrect direction)	1 (0.9%)	2 (0.8%)	1 (0.6%)	4 (0.8%)
IX + n (correct direction)	5 (4.5%)	2 (0.8%)	5 (3%)	12 (2.4%)
IX + CL		1 (0.4%)		1 (0.2%)
Null forms	1 (0.9%)	146 (61.9%)	18 (11%)	165 (32.5%)
	112	236	164	507

- D/hh children use fewer pointing signs (IX as determiners or pronouns, 5.9%) than adults do (24%).
- Bare nouns predominate across all discourse contexts (ranging from 30 to 80%).

# Findings: HKSL narratives (d/hh children)

Linguistic forms	introduction	maintenance	reintroduction	Total
n	86 (76.8%)	75 (31.8%)	136 (82.9%)	297 (58.6%)
HAVE + n	14 (12.5%)		1 (0.6%)	15 (3%)
IX (correct direction)		9 (3.8%)	3 (1.8%)	12 (2.4%)
IX (unclear/incorrect direction)		1 (0.4%)		1 (0.2%)
IX + n (unclear/incorrect direction)	1 (0.9%)	2 (0.8%)	1 (0.6%)	4 (0.8%)
IX + n (correct direction)	5 (4.5%)	2 (0.8%)	5 (3%)	12 (2.4%)
IX + CL		1 (0.4%)		1 (0.2%)
Null forms	1 (0.9%)	146 (61.9%)	18 (11%)	165 (32.5%)
	112	236	164	507

- Distributional patterns suggest that they are aware of the mapping between nominal forms and referential functions.
- Pronouns are only found in definite contexts. Null forms mainly used for maintenance.

Linguistic forms of NPs for referencing purposes	Proficiency levels				Total (n=1)
	(highest-----lowest)				
	4th (n=3)	3rd (n=4)	2nd (n=5)	1st (n=3)	
n	61 (37%)	77 (57%)	110 (72%)	49 (91%)	297
HAVE + n		5 (4%)	8 (5%)	2 (4%)	15
IX (correct direction)	10 (6%)	2 (1%)			12
IX (unclear/incorrect direction)		1 (1%)			1
IX + n (correct direction)	9 (5%)	2 (1%)	1 (1%)		12
IX + n (unclear/incorrect direction)	1 (1%)	2 (1%)	1 (1%)		4
IX + CL	1 (1%)				1
Null forms	84 (51%)	46 (34%)	32 (21%)	3 (6%)	165
	166	135	152	54	507

- Some influence from spoken Cantonese, as evidenced by some instances of using the sign HAVE for introducing referents.
- As signing proficiency improves, d/hh children produce:
  - Fewer bare nouns, more pointing signs and more null forms, most of which in appropriate contexts.

Linguistic forms of NPs for referencing purposes	Proficiency levels				Total (n=1)
	(highest-----lowest)				
	4th (n=3)	3rd (n=4)	2nd (n=5)	1st (n=3)	
n	61 (37%)	77 (57%)	110 (72%)	49 (91%)	297
HAVE + n		5 (4%)	8 (5%)	2 (4%)	15
IX (correct direction)	10 (6%)	2 (1%)			12
IX (unclear/incorrect direction)		1 (1%)			1
IX + n (correct direction)	9 (5%)	2 (1%)	1 (1%)		12
IX + n (unclear/incorrect direction)	1 (1%)	2 (1%)	1 (1%)		4
IX + CL	1 (1%)				1
Null forms	84 (51%)	46 (34%)	32 (21%)	3 (6%)	165
	166	135	152	54	507

- The production of IX (pronouns) and IX + n (determiner + noun) provide evidence that the d/hh children have acquired the nominal structure by the time they reach the highest level of signing proficiency within this data set.
- D/hh children are approaching adult grammar in their development of nominal structures and referencing skills.

# Findings: Cantonese narratives (adult)

Referential properties	Types of Norminal Expressions	Hearing Adults, n = 6					
		Introduction (%)		Maintenance (%)		Reintroduction (%)	
Indefinite	Existential constructions	31	77.5%				
	(num )+ CL + N (postverbal)	3	7.5%				
	Num + cl + n (as object)	2	5%				
Indefinite/Definite	CL + N (as object)			8	7%	16	25%
Definite	CL + N (as subject)	3	7.5%	15	13%	23	35%
	CL + N (as topic)					1	2%
	det + (num) + cl + n (as subj)			1	1%		
	det + (num) + cl + n (as obj)			1		2	3%
	Null form			42	38%		
	pronouns			34	30%	6	9%
	Ah + N					2	3%
Definite if interpreted as proper names	Bare NP (subj)	1	2.5%	9	8%	14	22%
	Bare NP (obj)			2	2%	1	2%

## Hearing adults:

- **Referent introduction:**

- most frequent - existential constructions (e.g. 有隻兔仔) (77.5%).

- **Referent maintenance:**

- null forms (38%) and pronominals (e.g. 佢)(30%) predominate.
- Some use of definite [cL+n] (e.g. 隻兔仔) and bare NPs (e.g. 兔仔).

- **Referent reintroduction:**

- Definite [cl + N] (e.g. 隻兔仔)(65%) is most frequent, followed by bare NPs (e.g. 兔仔).
- Pronominals (e.g. 佢) are less preferred (9%).

# Findings: Cantonese narratives (d/hh children)

Referential properties	Types of nominal expressions	All deaf/hard-of-hearing children, n=15					
		Introduction		Maintenance		Reintroduction	
Indefinite	Existential constructions	25	29%	1	1%	2	2%
	Num + cl + n (as object)	3	3%	1	1%		
indefinite/definite	CL + N (as object)			1	1%	4	3%
Definite	CL + N (as subject)	5	6%	3	2%	6	5%
	det + (num) + cl + n (as subj)	1	1%				
	det + (num) + cl + n (as topic)					1	1%
	possessive					1	1%
	Null form			72	44%	14	11%
	pronouns			19	12%	4	3%
Definite if interpreted as proper names	Bare NP (subj)	40	46%	50	30%	60	48%
	Bare NP (obj)	12	14%	17	10%	31	25%
	Bare NP (topic)			1	1%	2	2%
Ungrammatical	Num + cl + n (as subj)	1	1%				

Referential properties	Types of nominal expressions	All deaf/hard-of-hearing children, n=15					
		Introduction		Maintenance		Reintroduction	
Indefinite	Existential constructions	25	29%	1	1%	2	2%
	Num + cl + n (as object)	3	3%	1	1%		
indefinite/definite	CL + N (as object)			1	1%	4	3%
Definite	CL + N (as subject)	5	6%	3	2%	6	5%
	det + (num) + cl + n (as subj)	1	1%				
	det + (num) + cl + n (as topic)					1	1%
	possessive					1	1%
	Null form			72	44%	14	11%
	pronouns			19	12%	4	3%
Definite if interpreted as proper names	Bare NP (subj)	40	46%	50	30%	60	48%
	Bare NP (obj)	12	14%	17	10%	31	25%
	Bare NP (topic)			1	1%	2	2%
Ungrammatical	Num + cl + n (as subj)	1	1%				

### Referent introduction:

Most frequent means: bare NPs (e.g. 兔仔)(46%+14%= 60%)

Existential constructions (less than 30%)

Referential properties	Types of nominal expressions	All deaf/hard-of-hearing children, n=15					
		Introduction		Maintenance		Reintroduction	
Indefinite	Existential constructions	25	29%	1	1%	2	2%
	Num + cl + n (as object)	3	3%	1	1%		
indefinite/definite	CL + N (as object)			1	1%	4	3%
Definite	CL + N (as subject)	5	6%	3	2%	6	5%
	det + (num) + cl + n (as subj)	1	1%				
	det + (num) + cl + n (as topic)					1	1%
	possessive					1	1%
	Null form			72	44%	14	11%
	pronouns			19	12%	4	3%
Definite if interpreted as proper names	Bare NP (subj)	40	46%	50	30%	60	48%
	Bare NP (obj)	12	14%	17	10%	31	25%
	Bare NP (topic)			1	1%	2	2%
Ungrammatical	Num + cl + n (as subj)	1	1%				

## Referent maintenance:

Null forms predominate (44%) → similar to hearing adults

A high % of bare NPs (41%) → outnumber pronominals (12%)

Referential properties	Types of nominal expressions	All deaf/hard-of-hearing children, n=15					
		Introduction		Maintenance		Reintroduction	
Indefinite	Existential constructions	25	29%	1	1%	2	2%
	Num + cl + n (as object)	3	3%	1	1%		
indefinite/definite	CL + N (as object)			1	1%	4	3%
Definite	CL + N (as subject)	5	6%	3	2%	6	5%
	det + (num) + cl + n (as subj)	1	1%				
	det + (num) + cl + n (as topic)					1	1%
	possessive					1	1%
	Null form			72	44%	14	11%
	pronouns			19	12%	4	3%
Definite if interpreted as proper names	Bare NP (subj)	40	46%	50	30%	60	48%
	Bare NP (obj)	12	14%	17	10%	31	25%
	Bare NP (topic)			1	1%	2	2%
Ungrammatical	Num + cl + n (as subj)	1	1%				

### Referent reintroduction:

Bare NPs predominate: 75%; lower % of null forms (11%) and pronominals (3%); very few instances of classifiers.

## Findings: Cantonese narratives (d/hh children)

- d/hh children can basically map existential constructions, null forms, pronominals and definite NPs with classifiers with the appropriate discourse situations.
- Very few pronouns or definite expressions containing classifiers and determiners are observed. → nominal structures not yet fully developed by the d/hh children of the highest level of proficiency in this study.
- Predominance of bare NPs across three discourse contexts.

	Hearing Adults	Hearing children	D/hh children
% of bare NPs in all contexts	12.3%	19.7%	55.6%

# Findings: Cantonese narratives (d/hh children)

- Such predominance of bare NPs does not appear to decrease with spoken language proficiency.

NP forms by d/hh children	Levels of Cantonese proficiency (lowest -----highest)			
	1st	2nd	3rd	4th
Non-bare NPs	2 (4.3%)	18 (15.8%)	16 (15.5%)	42 (37.2%)
bare NPs	33 (71.7%)	59 (51.8%)	63 (61.2%)	58 (51.3%)
Null forms	11 (23.9%)	37 (32.5%)	24 (23.3%)	13 (11.5%)
Grand Total	46	114	103	113

- What factor(s) contribute(s) to the persistence of bare NPs in the Cantonese narratives by d/hh children? Is this developmental in nature? Or is it a transfer effect from HKSL, given that bare NPs can occur in both definite and indefinite contexts in HKSL?

# Summary

- In both signing and spoken narratives, the d/hh children demonstrate the awareness of the mapping between different types of nominal expressions and discourse functions. For example,
  - Null forms and pronouns are mostly used in maintenance contexts.
  - Full lexical nominal expressions are far more likely than pronouns to be used for reintroductions.
- In both signing and speech, d/hh children of the lowest language proficiency produce a high % of bare NPs (i.e. no pointing determiners/demonstratives/classifiers).

# Discussion

- For signing narratives, this predominance of bare NPs decreases gradually as the signing proficiency improves:
  - % of bare NPs and signing proficiency are significantly correlated ( $r = - 0.937$ ,  $p < 0.05$ , two-tailed)
- However, for spoken narratives, the predominance of bare NPs persists despite improvements in spoken language proficiency:
  - % of bare NPs and spoken proficiency are moderately correlated ( $r = - 0.639$ ,  $p < 0.05$ , two tailed)
  - This suggests that the predominance of bare NPs is NOT *merely developmental*.

# Discussion

- What factor(s) may contribute to the persistence of bare NPs in the Cantonese narratives of the d/hh children?
- If this is an effect of interlinguistic transfer from HKSL, we might see:
  1. a correlation between % of bare NPs in Cantonese and the signing proficiency of HKSL
  2. a correlation between % of bare NPs in Cantonese and the % of bare NPs in their signing production.

# Discussion

- No correlation between % of bare NPs in Cantonese narratives and signing proficiency.  
( $r = - 0.090129$ ,  $p > 0.05$ , not significant).
- No correlation between % of bare NPs in the Cantonese narratives and the % of bare NPs in the HKSL narratives.  
( $r = - 0.001212$ ,  $p > 0.05$ , not significant)

# Discussion

- Regarding the internal word order of NPs in spoken Cantonese narratives, there is no evidence of HKSL transfer either.
  - Cantonese: [DET NUM CL N] (e.g. 呢三隻兔仔)
  - HKSL: [IX-det N NUM] / [ N NUM IX-det]
- In the Cantonese narrative data, we found not even one instance of deviant NP-internal word order. Apparently d/hh children have already had a sound knowledge of NP-internal word order of Cantonese by the time they produce these NPs.
- Hence, it is RATHER UNLIKELY that the predominance of bare NPs is an interlinguistic transfer effect from sign language.

# Discussion

- Another possible factor is the influence of written Chinese which is based on Mandarin grammar.
- Unlike Cantonese, Mandarin makes use of bare NPs in both definite and indefinite contexts.
- In fact, previous studies on discourse referencing in Mandarin indeed reported a high percentage of bare nouns in both adult and children data (Hickmann & Liang, 1990; Hickmann, 2003).
- Yiu (2012): observed that the d/hh children's acquisition of double object constructions in Cantonese is influenced by the corresponding structures in Mandarin.

# Discussion

- Hu (2014):
  - a study on the acquisition of written Mandarin of 22 d/hh children of the same co-enrolment programme (subject pool included some of the d/hh children of this study)
  - Evidence of the acquisition of NP structures by Primary Two.
- Given that written Mandarin is visually accessible, and that the d/hh children have daily exposure to it in school across all subjects except the English lessons, their knowledge of written Mandarin might have been transferred to their Cantonese speech data.
- Unfortunately we don't have the corresponding written Chinese data from these d/hh children. Future research is needed to evaluate the effect of transfer from Mandarin Chinese.
